AWS · Terraform · Amazon Bedrock

My Bedrock script worked as admin. Then I took the permissions away.

Grace King'ori · AWS Certified Cloud Practitioner · Nairobi

Admin can do anything

What my script needs

Call one Amazon Bedrock model

What my admin user can do

Everything in my AWS account

If those credentials ever leaked, so would access to all of it.

One role. One model. Nothing else.

The policy

Allows one action, on one model's ARN

The role

Holds that policy and nothing more

The trust policy

Says only my user can step into it

Built with Terraform. The plan said 3 to add.

Same role: allowed, then denied

```
(.venv) root@Bobo:~/bedrock-hello# AWS_PROFILE=bedrock-role python hello.py
Infrastructure as Code (IaC) is a method of managing and provisioning IT infrastructure through machi
ne-readable configuration files, rather than physical hardware or interactive configuration tools. Th
is approach allows for version control, automation, and scalability of infrastructure deployments.
(.venv) root@Bobo:~/bedrock-hello# aws s3 ls --profile bedrock-role

aws: [ERROR]: An error occurred (AccessDenied) when calling the ListBuckets operation: User: arn:aws:
sts::            :assumed-role/bedrock-nova-micro-role/botocore-session-1794399818 is not authorized
to perform: s3:ListAllMyBuckets because no identity-based policy allows the s3:ListAllMyBuckets actio
n
```

Bedrock call: worked

S3 call: AccessDenied

What I took from it

Copied output isn't always ready to paste

Quotation marks around my role ARN made the CLI call it invalid.

Check git status before you commit

Mine showed a Terraform state file about to go to GitHub.
